APPROVED JURISDICTIONAL DETERMINATION FORM **U.S. Army Corps of Engineers**

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SE	CTION I: BACKGROUND INFORMATION
A.	REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD):
В.	DISTRICT OFFICE, FILE NAME, AND NUMBER: Detroit District, McDaniel's Harley-Davidson, LRE-2006-1710330
C.	PROJECT LOCATION AND BACKGROUND INFORMATION: State:Indiana County/parish/borough: St. Joseph City: Mishawaka Center coordinates of site (lat/long in degree decimal format): Lat. 41-37-31.95° N, Long. 86-10-22.55° W. Universal Transverse Mercator: Name of nearest waterbody: unnamed tributary to St. Joseph River Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: St. Jopseph River Name of watershed or Hydrologic Unit Code (HUC): Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request. Check if other sites (e.g., offsite mitigation sites, disposal sites, etc) are associated with this action and are recorded on a different JD form.
D.	REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY): ☐ Office (Desk) Determination. Date: ☐ Field Determination. Date(s): June 18, 2008
SE	CTION II: SUMMARY OF FINDINGS
A.	RHA SECTION 10 DETERMINATION OF JURISDICTION.
	re Pick List "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the iew area. [Required] Waters subject to the ebb and flow of the tide. Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. Explain: .
B.	CWA SECTION 404 DETERMINATION OF JURISDICTION.
The	ere Pick List "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]
	1. Waters of the U.S. a. Indicate presence of waters of U.S. in review area (check all that apply): TNWs, including territorial seas Wetlands adjacent to TNWs Relatively permanent waters² (RPWs) that flow directly or indirectly into TNWs Non-RPWs that flow directly or indirectly into TNWs Wetlands directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs Impoundments of jurisdictional waters Isolated (interstate or intrastate) waters, including isolated wetlands
	b. Identify (estimate) size of waters of the U.S. in the review area: Non-wetland waters: linear feet: width (ft) and/or acres. Wetlands: 1.53 acres.
	c. Limits (boundaries) of jurisdiction based on: 1987 Delineation Manual Elevation of established OHWM (if known):
	 Non-regulated waters/wetlands (check if applicable):³ Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional. Explain:

¹ Boxes checked below shall be supported by completing the appropriate sections in Section III below.
² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least "seasonally" (e.g., typically 3 months).

³ Supporting documentation is presented in Section III.F.

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1.	TNW	
	Identify TNW:	

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent":

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody⁴ is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

Watershed size: unknown, but probably just under 5 **square miles** Drainage area: unknown, but probably just under 5 **square miles** Average annual rainfall: 39.75 inches

Average annual snowfall: 76.3 inches

(ii) Physical Characteristics:

(a) Relationship with TNW:

☐ Tributary flows directly into TNW.

Tributary flows through 2 tributaries before entering TNW.

Project waters are 2-5 river miles from TNW.

Project waters are 1 (or less) river miles from RPW.

Project waters are 2-5 aerial (straight) miles from TNW.

Project waters are 1 (or less) aerial (straight) miles from RPW.

Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW⁵: From wetland to roadside ditch to unnamed tributary (blue line on USGS) to St. Joseph River.

⁴ Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

⁵ Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

	Tributary stream order, if known:
(b)	General Tributary Characteristics (check all that apply): Tributary is:
	Tributary properties with respect to top of bank (estimate): Average width: feet Average depth: feet Average side slopes: Pick List.
	Primary tributary substrate composition (check all that apply): Silts Sands Concrete Cobbles Gravel Muck Bedrock Vegetation. Type/% cover: Other. Explain:
	Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: Presence of run/riffle/pool complexes. Explain: Tributary geometry: Relatively straight Tributary gradient (approximate average slope): relatively steep for the region, with a drop of about 50 feet in less than a astream from site where the tributary has created a small ravine, The ravine flattens out as thr tributary enters the ancie he St. Joseph River (spanning about two mile with a drop of about 50 feet)%
· · ·	Flow: Tributary provides for: Seasonal flow Estimate average number of flow events inreview area/year: 11-20 Describe flow regime: Other information on duration and volume: flow is seasonal but also likely realized during heavier precipitation events Surface flow is: Discrete and confined. Characteristics: appears that a relativelybroad headwaters area (where the site
is located) fun	Subsurface flow: Pick List. Explain findings: Dye (or other) test performed:
	Tributary has (check all that apply): Bed and banks OHWM ⁶ (check all indicators that apply): clear, natural line impressed on the bank the presence of litter and debris destruction of terrestrial vegetation the presence of wrack line sediment sorting sediment sorting sediment deposition the presence of wrack line sediment sorting sediment deposition multiple observed or predicted flow events abrupt change in plant community other (list): Discontinuous OHWM. Explain:
	If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply): High Tide Line indicated by:
(iii) Che	mical Characteristics:

⁶A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody's flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break.

⁷Ibid.

Characterize tributary (e.g., water color is clear, discolored, oily film, water quality; general watershed characteristics, etc.). Explain noticeably dirty water was observed running from adjacent parking lot and roadways into the wetlands and ditch.

Identify specific pollutants, ifknown: not known, but most likely sediments carried by stormflows and car-related oils/greases

	(iv)	Biological Characteristics. Channel supports (check all that apply):
		Riparian corridor. Characteristics (type, average width):
		Wetland fringe. Characteristics: .
		Habitat for:
		☐ Federally Listed species. Explain findings: ☐ Fish/spawn areas. Explain findings:
		☐ Other environmentally-sensitive species. Explain findings:
		☐ Aquatic/wildlife diversity. Explain findings: .
		Aquatic/whitine diversity. Explain initialigs.
2.	Cha	aracteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW
	(i)	Physical Characteristics:
	(-)	(a) General Wetland Characteristics:
		Properties:
		Wetland size:1.53 acres
		Wetland type. Explainemergent/scrub-shrub.
		Wetland quality. Explain: .
		Project wetlands cross or serve as state boundaries. Explain: .
		(b) General Flow Relationship with Non-TNW:
		Flow is: Pick List . Explain:
		Surface flow is: Pick List
		Characteristics: .
		Characteristics.
		Subsurface flow: Pick List. Explain findings: .
		Dye (or other) test performed:
		(c) Wetland Adjacency Determination with Non-TNW:
		☐ Directly abutting
		Not directly abutting
		Discrete wetland hydrologic connection. Explain: pipe observed during rain fall event
		Ecological connection. Explain:
		Separated by berm/barrier. Explain: highway berm constructed between wetland and roadside ditch.
		(1) D (1) (D 1) (1) (TD TW)
		(d) Proximity (Relationship) to TNW
		Project wetlands are 2-5 river miles from TNW.
		Project waters are 2-5 aerial (straight) miles from TNW. Flow is from: Wetland to navigable waters.
		Estimate approximate location of wetland as within the Pick List floodplain.
		Estimate approximate rocation of wettand as within the rek List moodplant.
	(ii)	Chemical Characteristics:
	()	Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed
		characteristics; etc.). Explain: The wetland is an emergent wetland dominated by cattails and sedges. The wetland
		receives water from the surronding development which leads to pollutants being discharged into the area.
		Identify specific pollutants, ifknown: parking lot and roadway runoff.
	(iii	Biological Characteristics. Wetland supports (check all that apply):
		Riparian buffer. Characteristics (type, average width):
		Vegetation type/percent cover. Explain:cattail marsh
		Habitat for:
		☐ Federally Listed species. Explain findings: ☐ Fish/spawn areas. Explain findings:
		☐ Pisn/spawn areas. Explain findings: ☐ Other environmentally-sensitive species. Explain findings:
		☐ Other environmentarrysensitive species. Explain findings: ☐ Aquatic/wildlife diversity. Explain findingsite is an "island" of marsh immediately surrounded by urban landsca
		and highway corridor-wildlife adpated to life in urban/nearurban landscapes will us
		the site
		tio orta
3.	Cha	aracteristics of all wetlands adjacent to the tributary (if any)
		All wetland(s) being considered in the cumulative analysis: Pick List
		Approximately () acres in total are being considered in the cumulative analysis.

For each wetland, specify the following:

Directly abuts? (Y/N)

Size (in acres)

Directly abuts? (Y/N)

Size (in acres)

other wetlands adjacent to the tributary not reviewed

Summarize overall biological, chemical and physical functions being performed: The wetlands are situated in the headwaters of a relatively small watershed that takes in runoff from an urban and agricultural landscap the wetlands desynchronize flood flows in a region that has recently experienced flooding and where flooding in the future should not be unexpected. The wetlands receive and filter/retain pollutants in the runoff from surrounding urbanagricultural areas. These wetlands play a more than insubstantial role in mitigating effects on the biological, chemical, and physical integrity of the St. Joseph River.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the *Rapanos* Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- ? Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- ? Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- ? Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- ? Does the tributary, in combination with itsadjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

- 1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:-.
- 2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus belowbased on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: The wetland area exhibits a surface water connection to traditional navigable waters. The tributary carries pollutants, flood waters, nutrients, and organic carbon to the St. Joseph River, which is a TNW. The adjacent wetlands have the ablitilty to reduce the amount of pollutants and floodwaters reaching the St. Joseph River. This is important as the area has demonstrated a good deal of flooding in the last couple of years. The apartment complex adjacent to this area (just downstream in the watershed) has flooded at least twice in the last year. This wetlandloes help decrease the amount of flooding in the area.
- 3.
 4. The subject site and its watershed are in a rapidly urbanizing landscape that still kaquite a bit of agricultural land abutting the unnamed tributary downstream from the project site. The subject ditch and unnamed tributary provide direct water inputs into the St. Joseph River, in the form of storm water and snow melt water. These inputs carry typical amounts of sediment and urban/agricultural chemicals that are not "diluted" via confluence with other downstream waters prior to entering the St. Joseph River—the sub watershed in question is basically a direct conduit for pollutants in the watershed to enter the St. Joseph River. Wetlands adjacent to this ditch and unnamed tributary store runoff water and reduce flood peaks downstream while removing pollutants before they enter the ditch and tributary. On an individual and cumulative bassi, the subject wetlands in this rapidly urbanizing landscape do maintain the biological, chemical, and physical integrity of the downstream, navigable St. Joseph River,

which is a large (4,685 square miles), bistate watershed with headwaters in Michigan,mid-watershed in Indiana, lower watershed back in Michigan, and an outlet into Lake Michigan.

- 5.
 6. The site is in the South Bend/Mishawaka Indiana region. The St. Joseph River Watershed Management Plan (Plan, Friends of the St. Joe River Association, 2005) notes this area is one of the key regions on the St. Joseph River with respect to water quality and public interst interst issues: The Plan states Continued development in the South Bend/Mishawaka and Elkhart/Goshen areas and along US 1-31 from Kalamazoo to Three Rivers pose a direct threat to habitat, natural features, agricultural land and ecological systems in the Paw Paw, Dowagiac and Rocky River sub-watersheds [watersheds downstream of the project site in Michigan] and also states "The St. Joseph/Benton Harbor, Elkhart/Goshen and South Bend/Mishawaka areas are critical urban areas in need of mitigation efforts centered around reduction and improved management of stormwater runoff." The subject wetlands are a low-cost remedy to these St. Joseph River issues.
- 8. With respect to such urban settings, the Plan also notes: "While the developing areas at the fringes of these major urban centers have more options to proactively manage stormwater (many of which are mentioned under the Critical Areas forPreservation section), protecting water quality in urbanized areas is difficult because of many factors, such as diverse pollutant loadings, large runoff volumes, limited areas suitable for treatment systems, high implementation costs for structural contils, and destruction, degradation, or absence of buffer zones to filter pollutants and stabilize streambanks and shorelines. Ironically, the establishment and preservation of buffers and natural floodplains (by policy, code, or ordinance) may be the singlemost important component of any plan to mitigate the impacts of storm water runoff. Once these features are lost, mitigation of stormwater runoff becomes more complicated and costly. Where existing development precludes the use of effective nonstructural controls such as buffers or bioretention cells, structural practices that control flooding and improve water quality might be the only suitable option to decrease the nonpoint source pollution loads generated from developed areas."
- 9.10. With respect to the above paragraph, we note the subject wetlands and similarly situated wetlands are already in place and acting as buffers, filters, and floodplains in the South Bend/Mishawaka portion of the St. Joseph River's watershed.11.
- 12. Large public investments havebeen made in expanding a salmonid fishery in the St. Joseph River as far upstream as Mishawaka, Indiana through the construction of fish passage channels around hyroelectric dams. Good water quality is important to the maintenance of fisheries downstream. As noted above, the subject wetlands help to maintain water quality in the St. Joseph River and thereby help maintain an interstate fishery.
- 13.14. St. Joseph River Watershed Management Plan June 2005 Andrew DeGraves
- 15. Watershed Coordinator, Friends of the St. Joe River Association. 281 pp..
- **16. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW.** Explain findings of presence or absence of significant nexus below based on the tributary in combination with all of it adjacent wetlands, thengo to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area: TNWs: linear feet width (ft), Or, acres. Wetlands adjacent to TNWs: acres.
RPWs that flow directly or indirectly into TNWs. ☐ Tributaries of TNWs where tributaries typically flow year-round are jurisdictional Provide data and rationale indicating that tributary is perennial: ☐ Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional Data supporting this conclusion is provided at Section III. B. Provide rationale indicating that tributaryflows seasonally:
Provide estimates for jurisdictional waters in the review area (check allhat apply): Tributary waters: linear feet width (ft). Other non-wetland waters: acres. Identify type(s) of waters: . Non-RPWs ⁸ that flow directly or indirectly into TNWs. Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional Data supporting this conclusion is provided at Section III.C.

⁸See Footnote # 3.

	Provide estimates for jurisdictional waterswithin the review area (check all that apply): Tributary waters: linear feet width (ft). Other non-wetland waters: acres. Identify type(s) of waters: .	
4.	Wetlands directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands directly abut RPW and thus are jurisdictionalas adjacent wetlands Wetlands directly abutting an RPW where tributaries typically flow yearound. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:	
	Wetlands directly abutting an RPW where tributaries typically flow "seasonally Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:	
	Provide acreage estimates for jurisdictional welands in the review area: acres.	
5.	Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands that do not directly abut an RPW, but when considered in combination withthe tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with TNW are jurisidictional Data supporting this conclusion is provided at Section III.C.	
	Provide acreage estimates for jurisdictional wetlands in the review area: acres.	
6.	Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs. Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have significant nexus with a TNWare jurisdictional Data supporting this conclusion is provided at Section III.C.	
	Provide estimates for jurisdictional wetlands in the review area 1.53 acres.	
7.	Impoundments of jurisdictional waters. As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional. Demonstrate that impoundment was created from "waters of the U.S.," or Demonstrate that water meets the criteria for one of the categories presented above (1-6), or Demonstrate that water is isolated with a nexus to commerce (see E below).	
ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY): 10 which are or could be used by interstate or foreign travelers for recreational or other purposes. from which fish or shellfish are or could be taken and sold in interstate or foreign commerce. which are or could be used for industrial purposes by industries in interstate commerce. Interstate isolated waters. Explain: Other factors. Explain:		
Ide	ntify water body and summarize rationale supporting determination:	
	vide estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: linear feet width (ft). Other non-wetland waters: acres. Identify type(s) of waters: Wetlands: acres.	

E.

 $^{^{9}}$ To complete the analysis refer to the keyin Section III.D.6 of the Instructional Guidebook.

¹⁰ Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.

NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY): If potential wetlands were assessed within the review area, these aras did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements. Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce. Prior to the Jan 2001 Supreme Court decision in "SWANCC," the review area would have been regulated basedsolely on the "Migratory Bird Rule" (MBR). Waters do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction. Explain: Other: (explain, if not covered above):
Provide acreage estimates for non-jurisdictional waters in the review area where the <u>sole</u> potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture) using best professional udgment (check all that apply): Non-wetland waters (i.e., rivers, strams): linear feet width (ft). Lakes/ponds: acres. Other non-wetland waters: acres. List type of aquatic resource: Wetlands: acres.
Provide acreage estimates for non-jurisdictional waters in the review area thatdo not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction(check all that apply): Non-wetland waters (i.e., rivers, streams) linear feet, width (ft). Lakes/ponds: acres. Other non-wetland waters: acres. List type of aquatic resource: Wetlands: acres.
UPPORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case filand, where checked and requested, appropriately reference sources below): Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant Data sheets prepared/submitted by or on behalf of the applicant/consultant. Office concurs with data sheets/delineation report. Office does not concur with data sheets/delineation report Data sheets prepared by the Corps: Corps navigable waters' study: U.S. Geological Survey Hydrologic Atlas: USGS NHD data.
